

AGeconomy

Technology combined with economy.

Description

The economy you want to maximize the results of your crop with the guarantee of efficiency and quality in the result of your planting.

The AGeconomy Planting Monitor was developed for the rural producer who wants to make use of intelligent technology, but who does not give up the economy when purchasing tools that can assist him in the field. In other words, it is the equipment that guarantees high productivity through low investment.

AGeconomy works in a simple and practical way, requiring the touch of just one key, and allows the installation of up to 18 lines of seed and fertilizer sensors in just one cable.

Like other Agral monitors, AGeconomy automatically identifies all sensors without the need for any configuration. In addition, these sensors are self-adjusting against dirt accumulation, reducing the maintenance periodicity and informing the right moment for revision or replacement.

Benefits:

- Economy, precision and efficiency in the field.
- Ease of operation.
- Higher grain yields.
- Fully automatic system, no configuration required.
- Able to monitor seed and fertilizer on all crops.
